# Learning Objectives

# Learning Objectives

## ► Classes

# Learning Objectives

- ▶ **Classes**
- ▶ **Objects**

# Learning Objectives

- ▶ **Classes**
- ▶ **Objects**
- ▶ **Encapsulation**

# Learning Objectives

- ▶ Classes
- ▶ Objects
- ▶ Encapsulation
- ▶ Data Abstraction

# Learning Objectives

- ▶ Classes
- ▶ Objects
- ▶ Encapsulation
- ▶ Data Abstraction
- ▶ We will do this with the help of an example

# System Requirements

# System Requirements

- ▶ Ubuntu OS v. 11.10

# System Requirements

- ▶ Ubuntu OS v. 11.10
- ▶ g++ Compiler v. 4.6.1

# Introduction

# Introduction

- ▶ Class is created using a keyword `class`

# Introduction

- ▶ Class is created using a keyword class
- ▶ It holds data and functions

# Introduction

- ▶ Class is created using a keyword class
- ▶ It holds data and functions
- ▶ Class links the code and data

# Introduction

- ▶ Class is created using a keyword class
- ▶ It holds data and functions
- ▶ Class links the code and data
- ▶ The data and functions of the class are called as members of the class

# Introduction

# Introduction

- Objects are variables

# Introduction

- ▶ Objects are variables
- ▶ They are the copy of a class

# Introduction

- ▶ Objects are variables
- ▶ They are the copy of a class
- ▶ Each of them has Properties and Behavior

# Introduction

- ▶ Objects are variables
- ▶ They are the copy of a class
- ▶ Each of them has Properties and Behavior
- ▶ Properties are defined through data elements

# Introduction

- ▶ Objects are variables
- ▶ They are the copy of a class
- ▶ Each of them has Properties and Behavior
- ▶ Properties are defined through data elements
- ▶ Behavior is defined through member functions called methods

# Syntax

# Syntax

```
► class class-name  
{  
    public/private/protected:  
    Data members  
    Member functions  
};
```

# Access Specifiers

- Public specifier

# Access Specifiers

- ▶ **Public specifier**

- ▶ The public specifier allows the data to be accessed outside the class

# Access Specifiers

- ▶ **Public specifier**
  - ▶ The public specifier allows the data to be accessed outside the class
  - ▶ A public member can be used anywhere in the program

# Access specifiers

- ▶ Private specifier

# Access specifiers

- ▶ **Private specifier**
  - ▶ The members declared as private cannot be accessed outside the class

# Access specifiers

- ▶ Private specifier
  - ▶ The members declared as private cannot be accessed outside the class
  - ▶ Private members can be used only by the members of the class

# Access Specifiers

- Protected specifier

# Access Specifiers

- ▶ Protected specifier
  - ▶ Protected members cannot be accessed from outside the class

# Access Specifiers

- ▶ Protected specifier
  - ▶ Protected members cannot be accessed from outside the class
  - ▶ They can be accessed by a derived class

# Scope Resolution Operator

# Scope Resolution Operator

- It is used to access hidden data

# Scope Resolution Operator

- ▶ It is used to access hidden data
- ▶ To access the variable or function with the same name we use `::` operator

# Scope Resolution Operator

- ▶ It is used to access hidden data
- ▶ To access the variable or function with the same name we use :: operator
- ▶ Suppose the local variable and the global variable have the same name

# Scope Resolution Operator

- ▶ It is used to access hidden data
- ▶ To access the variable or function with the same name we use :: operator
- ▶ Suppose the local variable and the global variable have the same name
- ▶ The local variable gets the priority

# Scope Resolution Operator

- ▶ It is used to access hidden data
- ▶ To access the variable or function with the same name we use :: operator
- ▶ Suppose the local variable and the global variable have the same name
- ▶ The local variable gets the priority
- ▶ We can access the global variable using :: operator

# Summary

- ▶ Encapsulation
- ▶ Data Abstraction
- ▶ Private members
  - ▶ eg. `int x;`
- ▶ Public functions
  - ▶ eg. `int area(int);`
- ▶ Classes
  - ▶ eg. `class square`

# Summary

- ▶ To create object
  - ▶ eg. `square sqr;`
- ▶ To call a function using object
  - ▶ eg. `sqr.area();`

# Assignment

- Write a program to find the perimeter of a given circle

# About the Spoken Tutorial Project

- ▶ Watch the video available at [http://spoken-tutorial.org/What\\_is\\_a\\_Spoken\\_Tutorial](http://spoken-tutorial.org/What_is_a_Spoken_Tutorial)
- ▶ It summarises the Spoken Tutorial project

# About the Spoken Tutorial Project

- ▶ Watch the video available at [http://spoken-tutorial.org/What\\_is\\_a\\_Spoken\\_Tutorial](http://spoken-tutorial.org/What_is_a_Spoken_Tutorial)
- ▶ It summarises the Spoken Tutorial project
- ▶ If you do not have good bandwidth, you can download and watch it

# Spoken Tutorial Workshops

## The Spoken Tutorial Project Team

- ▶ Conducts workshops using spoken tutorials
- ▶ Gives certificates to those who pass an online test
- ▶ For more details, please write to [contact@spoken-tutorial.org](mailto:contact@spoken-tutorial.org)

# Acknowledgements

- ▶ Spoken Tutorial Project is a part of the Talk to a Teacher project
- ▶ It is supported by the National Mission on Education through ICT, MHRD, Government of India
- ▶ More information on this Mission is available at:
